

ABSTRACT OF THE DISCLOSURE

The game machine includes start detection means for detecting a manipulation to designate ball shooting that differs from a manipulation to cause a prescribed member to rotate, control means for causing a shooting operation of the balls by a number stored in storage means to be started in response to detection of the start detection means and for causing the ball shooting to be stopped once the balls of the number stored in the storage means have been shot, and stop detection means for detecting a stop manipulation of the balls. The control means causes the ball shooting to be stopped in response to detection of the stop manipulation. Thus, manipulability for shooting balls is improved. Further, a game well reflecting the player's will to stop the ball shooting is provided.
